Message

Dear Colleagues:

Thank you very much for supporting and attending TOPIC 2004 (the 2004 Tokyo Percutaneous Coronary Intervention Conference) despite your hectic schedules. We are delighted to have spent meaningful time with so many participants, and that the Conference was able to invite the overseas faculty members whom we could not accommodate the previous year. Above all, we wish to express our heartfelt gratitude to the faculty, who drew TOPIC 2004 to such a successful conclusion.

Coronary intervention is evolving at the fastest pace among all cardiovascular disease treatments, with outstanding developments year by year and the rapid compilation of new evidence. As this is a treatment procedure, experience-based medicine is also valuable, so it is important for coronary intervention to function relying on both evidence-based treatment and experience-based treatment as if they were two wheels of the same cart. From this perspective, academic discussions alone are insufficient to spread techniques and educate doctors about certain aspects of coronary intervention. Thus discussions of treatment methods and technical issues during live demonstrations, which provide technical guidance, are meaningful and necessary.

The use of drug eluting stents (DES) was approved last year in Japan, which is now making the transition from the stent era to the DES era. Today, medical practitioners must consider the role of Bare Metal Stents (BMS), the optimal means of inserting DES, the roles of intravascular ultrasound (IVUS) and other diagnostic imaging apparatus, and the roles of directional coronary atherectomy (DCA), rotabators and other atherectomy devices. In evaluating these treatment strategies, which each have their particular strengths and weaknesses, the weight given to the various items – such as the initial success rate, simplicity of technique, likelihood of restenosis, level of invasiveness and cost – varies greatly by institution and by individual practitioner. Our Conference provides a venue for frank discussions, using individual cases, regarding the various approaches and technical issues. TOPIC positively affirms diversity, that is, we aim at exhibiting a wide spectrum of treatment strategies backed by superior technologies.

Following from last year, we plan to invite international faculty to present lectures as an integral part of TOPIC 2005. Beyond providing the latest information, this offers us with an excellent opportunity to recognize the distinctive characteristics of coronary intervention in Japan by learning about the current conditions and ways of thinking worldwide.

Finally, since the existence of peripheral arterial disease (PAD) is an independent risk factor for vital prognosis, we plan to focus on catheter-based PAD treatment in the future.

TOPIC 2005 (the 2005 Tokyo Percutaneous Coronary Intervention Conference) will be held for the objectives outlined above. It is an effort to help spread and educate doctors about appropriate and safe coronary intervention techniques, and hopefully contribute to the diagnosis and treatment of coronary disease and the progress of research.

TOPIC 2005 will take place from July 21st through July 23rd at the Cerulean Tower Tokyu Hotel, the same location as last year. We extend our warmest invitation to each and every one of you, and sincerely hope that you will join with us this summer for TOPIC 2005.
